**Elephant House opens at Copenhagen Zoo**

The new Elephant House at Copenhagen Zoo opened today following an official ceremony attended by His Royal Highness the Prince Consort of Denmark and his grandson, Prince Christian.

This new Elephant House provides these magnificent animals with a stimulating environment, including easily accessible spaces for the public to enjoy them, and restores the visual relationship between the zoo and the park.

The project has been driven by research into the behavioural patterns of elephants. The tendency for bull elephants in the wild to roam away from the main herd prompted a plan organised around two separate enclosures. Covered with lightweight, glazed domes to provide natural light, these enclosures are designed to bring a sense of light and openness to a building type traditionally characterised as closed. The spaces maintain a strong visual connection with the sky and changing patterns of daylight and the distinctive fritting on the glazing simulates a canopy of trees. The varying levels on the site are exploited in cross-section. The elephant enclosures are set deep into the ground, ensuring excellent insulation on the perimeter walls and a natural fusion with the landscape. Additionally, the glazed domes have opening windows to allow natural ventilation and there is a heat recovery system further enhancing the environmental efficiency of the scheme.

The Elephant House is Foster + Partners first zoological building. Inserted into the natural contours of the site, it replaces a structure dating from 1914 and sets new standards in zoological design, providing the animals with a stimulating environment that recreates aspects of their former Asian habitat. It is built with a warm terracotta-coloured concrete and the yellow beach-like sand that naturally existed on the site has been recycled to create the paddocks. The colours and textures convey a sense of the dry riverbed as found at the edge of the rainforest a favourite haunt of Asian elephants. With mud holes, scattered pools of water and shading objects, the new Elephant House is a place where the animals can play and interact naturally. Broad public viewing terraces run around the domes externally, while a ramped promenade leads down into an educational space, looking into the enclosures along the way.

"As our first zoo project, we were asked to create a new enclosure for a herd of Asian Elephants in Denmark's renowned Copenhagen Zoo. We have designed a building that not only responds to the animals natural behaviour, but is also a seamless insertion into the landscape that uses the sites natural properties to provide thermal insulation. We are
